### Annotation

This document is the user guide for the DrufelCNC software. The information contained in this document may be modified by employees of the company with the subsequent notification. Your changes are reflected in the document version. The company does not guarantee the absence of errors or typographical errors in this document, but will work to eliminate them, and will also be grateful to everyone who finds them and points to them.

Comments and suggestions to this document are accepted by email: social@drufelcnc.com. Document version - V.1.17.

### **NOTICE OF LIABILITY**

Using any CNC machine is a dangerous operation. All precautions must be taken, as the machines may turn on at any time, the software MAY malfunction at any time, any user of the Software must understand and take this into account, and must immediately uninstall the Software and not proceed with the installation if they are not fully understand all the consequences of the use, as well as the fact that in case of misuse, the wrong code, unexpected movement or any damage caused by the aforementioned consequences mi, there is no legal protection.

# **1. Features**

- Support for CNC controlled 4-Axis, can connect five stepper motor drivers or servo drives.
- Power of the control board: voltage 12-24 V DC, current more than 500 mA.
- The maximum frequency of the output pulse is 100 kHz, and the pulse width can automatically change depending on the frequency of the pulse.
- Support for the operating system Windows XP, Windows 7 (32 / 64bit), Windows 8, Windows 10.
- Applicable to all versions of DrufelCNC software.

### 2. Product connection define and method

# **Probe input connection**

### End switch input connection

- 4 Common IO output interface.
- 5 Stepper motor control interface.
- 6 Spindle Control Output Port.

# 4. Connection diagram stepper motors and spindle

# **5. Installing DrufelCNC**

To install the program you need to download the installation files on the official website www.drufelcnc.com. You can use one of the following files:

- DrufelCNC\_installer\_x64.exe, DrufelCNC\_installer\_x32.exe this installation file will automatically install DrufelCNC on your computer documentation and examples of g-codes;
- DrufelCNC.zip archive with DrufelCNC x32 and x64 with examples and documentation.

Run the desired file and follow the installation instructions.

### **Description of the installation process**

**1.** *Start the installation process.* In this installation window you need to select the program installation mode.

2. *License Agreement.* The License Agreement installation window contains the text of the license agreement for the use of the DrufelCNC software product. Please read the agreement and select "I accept the terms of the license agreement". To continue the installation, click "Next." During the entire installation process, to return to the previous installation step, click the Back button. To exit the installer, click Cancel.

Setup - DrufelCNC version 1.17 -		×
License Agreement Please read the following important information before continuing.		Ø
Please read the following License Agreement. You must accept the terms of this agreement befo continuing with the installation.	re

# 7. Run the program

To run the program, use the version depending on the bitness of your operating system:

- DrufelCNCx32.exe version for 32-bit operating systems
- DrufelCNCx64.exe version for 64-bit operating systems

The main window of the program.

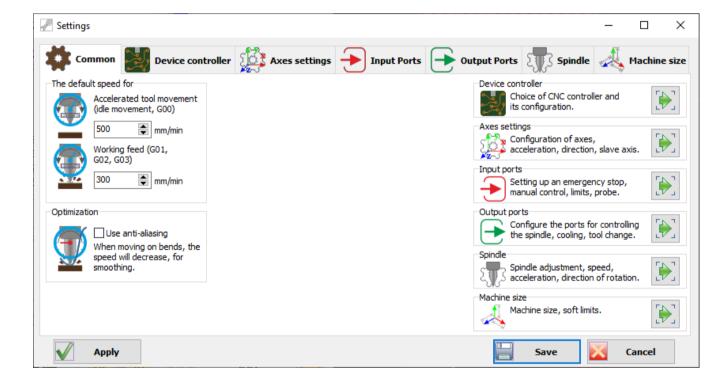

In the lower left corner displays the status of the connection to the USB controller, and other informational messages.

## 8. Customization

To configure DrufelCNC you must click on the button with the image of the key Next, go to the section of settings that interests you.

#### a. Common

In the common tab, you can set values for accelerated tooth movement (idle movement, G00), working feed (G01, G02, G03) and use anti-aliasing.

Use anti-aliasing When moving on bends, the speed will decrease, for smoothing. When moving along curved vectors, the speed of movement will decrease.

### **b.** Controller Configuration

In the window that opens, go to the «Device Controller» tab.

Settings								-		×
Common	Device controller	Axes setti	ngs 🔶	Input Po	orts 🔶 Output	Ports	<b>Spi</b>	ndle 🍂	Machine	siz
evices:					Automatic s	election of	supported	device	🖄 Refre	sh
Name	Manufacturer	VID	PID	Version	Serial number	Outp	Input

	iands	_		Stand	Device mode ard MPG V			_	_	>
Period sending comm 5 ms	$\sim$		The							>
Period sending comm 5 ms The duration of the o 5 us	$\sim$		The		ard MPG 🛛 🗸					>

In the hardware section, you must select a controller by setting a point in the radio button block opposite the USB controller. Save the settings.

### c. Axis Setup

To configure a stepper motor or servo drive, go to the Axis Settings tab.

P Settings	-		×
Common Device controller 🖉 Axes settings 🔶 Input Ports 💽 Output Ports Spindle	4	Machine s	ize
Setting the axis X Impulses at 1 mm Speed mm/min Acceleration mm/min Invert direction Invert step Backlash mm Invert direction Invert step Backlash mm Invert direction Invert step Invert Invert step Invert Invert step Invert Inver	Slar	ve axis - V	^
Setting the axis Y Impulses at 1 mm Speed mm/min Acceleration mm/min Invert direction Invert step Backlash mm Invert direction Invert step Backlash mm Invert direction Invert step Invert Invert step Invert Invert step Invert Inver	Slar	ve axis - V	
Setting the axis Z Impulses at 1 mm Speed mm/min Acceleration mm/min Invert direction Invert step Backlash mm Invert direction Invert step Backlash mm Invert direction Invert step Invert Invert step Invert Invert step Invert Inver	Slar	ve axis - V	
Setting the axis A Impulses at 1 mm Speed mm/min Acceleration mm/min Invert direction Invert step Backlash mm Dir Invert direction Invert step Invert Invert step Invert Invert direction Invert step Invert Inver	Slar	ve axis - V	
Setting the axis B Impulses at 1 mm Speed mm/min Acceleration mm/min Invert direction Invert step Backlash mm 320 1500 20 20 Dir Invert Impl Step Invert 0 20	Slav	ve axis - V	~
Apply Save	C	ancel	

Set the required number of pulses for each axis. Save the settings. If necessary, specify the submission of the axes. Use the inversion setting to change the direction of rotation of the motor.

Enabled	Enables the axis to be displayed in the coordinate list.
Impulses at 1 mm	The number of pulses per millimeter. You can use the calibration function to calculate.
Speed mm/min	Maximum speed of the axis movement.
Acceleration mm/min	Smooth acceleration of the axis movement.
Invert direction	Invert the direction of movement of the axis.
Invert step	Invert the step signal when transmitting the axis movement commands.
Backlash mm	Backlash of the ball screw.

A slave axis can be defined for an axis. Then, the slave axis will move along with the current.

## i. Calibrate axis

By clicking on the calibration button For a specific axis, the axis calibration window will open. This window is for calculating the number of pulses per mm.

Attention! This speed must be slow! This is necessary so that you can quickly respond to an emergency and not damage the machine.

After that click on the «Start move» **button**. After pressing the button, movement will begin for the specified segment.

Calibrate X-axis		×
Calibr	ate	X-axis
Move to, mm 50 50 50 50 50 50 50 50 50 50		The tool has moved to, mm
	_	Apply Cancel

After the tool has finished moving, use the ruler to measure the actual distance the tool moved.

Enter this value in the «The tool has moved» to field.

Calibrate X-axis		×
Calibr	ate	X-axis
Move to, mm 50 50 Move speed, mm/min 300 Start move Stop move		The tool has moved to, mm
		Apply Cancel

Click the «Calculate» Calculate button. After pressing, the number of pulses per 1 mm will be calculated that you need to set for the axis to be calibrated.

💋 Calibrate X-axis	×
Calibrat	e X-axis
Move to, mm 50 Move speed, mm/min	The tool has moved to, mm
Stoped     Stop move	Calculate Set 1600 pulses per millimeter.
	Apply Cancel

Click the «Apply» Apply button to apply the calculation results.

# d. Configure Input Ports

To configure input ports, go to the Input Ports tab.

Enable Y axle	0	No No	Low					
Enable Z axle	0	No No	Low					
Enable A axle	0	No No	Low					
Enable B axle	0	No No	Low					
Enable C axle	0	No No	Low					

Set the output port numbers according to the configuration of the machine and the CNC controller. Save the settings.

# f. Spindle adjustment

To configure the spindle parameters, you need to go to the "Spindle" tab.

P Settings		- 🗆 X
Common 🛃 Device controller	Axes settings 🔶 Input Ports 💽 Output Ports 🐺 S	pindle 📈 Machine size
Spindle specifications	Direction of rotation of the spindle	
Spindle speed (rpm) 6000		
Acceleration (rpm/10ms)	O Clockwise	
Spindle coefficient		
Output signal (0.0 - 1.0)          I         Speed signal multiplier		
Apply	Save	Cancel

Set the speed and acceleration parameters according to the spindle

specification. Set the default spindle rotation direction.

Set the spindle coefficient. Save the settings.

6000

# **Spindle speed**

Spindle speed (rpm) -- the nominal number of revolutions per minute

for your spindle.

# Acceleration

- when the spindle is turned on, the spindle

rotation speed will be smoothly set in accordance with the specified acceleration.

# Spindle coefficient

speed signal multiplier - if you need to calibrate the output value

of the port 0-10V then change this multiplication factor.

With this Counterclockwise/Clockwise setting,

you can set the direction of rotation of the spindle when you press the «Turn

the spindle» window.

# g. Machine size

With these settings you can customize the machine dimensions, soft limits, home function.

🖉 Settings		- 🗆 X
Common Device controller	Axes settings  Input Por	ts 🕞 Output Ports 🛒 Spindle 🙏 Machine size
Size axis X Axis minimum, mm Axis maximun, mm Axis maximun, mm Axis maximun, mm Axis maximun, mm	Soft Limit for X axis Use for Safe, slow, mm Min Max 10	Home X-axis function Home direction Home order Speed, mm/min To max To max Home order Speed, mm/min

Size axis C Axis minimum, mm Axis maximun, mm Axis maximun, mm Interpretation of the second s	Soft Limit for C axis Use for Safe, slow, mm	Home C-axis function Home direction Home order Speed, mm/min To max 6 (2) (300) (1) (2) (300) (2) (300) (30)
Apply		Save Cancel

### i. Size axis

Set the min / max limits for your machine.

Attention! The limits are specified in machine coordinates. The difference between the min and max should be the actual axis length of your machine.

According to these settings in the 3D model window, the dimensions of the axis will be displayed as a quadrilateral in each plane.

### ii. Soft limit

DrufelCNC - software for controlling CNC machines. Read more: https://drufelcnc.com

If you want the tool to stop when it reaches the minimum and maximum of your axis, use the appropriate constraints. These settings are designed to not damage your machine.

Soft Limit for X axis Use for Safe, slow, mm
Min 10 📩
Soft Limit for Y axis Use for Safe, slow, mm
Min 10 🛉
Soft Limit for Z axis Use for Safe, slow, mm
Min 🕂 Max 🚍 10 🔹
Soft Limit for A axis Use for Safe, slow, mm
Min 10 🛉
Soft Limit for C axis Use for Safe, slow, mm
Min 🚺 🗆 Max 🤶 10 🚔

will stop and prevent it from moving towards the minimum.

Image → When the maximum limit of your axis is reached, the tool will stop moving and prevent it from moving towards the maximum.

if the specified value remains before reaching the minimum or maximum, the tool speed is reduced to the minimum.

Safe, slow, mm

#### iii. Home function

With these settings you can set the driving direction, priority and speed.

These settings are for buttons **Real Real Real OF State** on the main window.

• when searching for the home position, the instrument will move to the minimum.

• when searching for the home position, the instrument will move to the maximum.

Attention! If you have turned on both the "To min" and "To max" settings, then when searching for the home position, the instrument will first move to the minimum and then to the maximum.

I = allows you to specify the order in which the search for the home position is performed for each axis.

home order = 1 will be executed very first.

Home order

Speed, mm/min

home order = 6 will be executed most recently.

 $\bigcirc$  is the speed of the tool when searching for the home position.

# 9. Run the control program (G-code)

To run the control program in the language of G-code, you must click on the

button with the image of the folder  $\swarrow$ , then select the file.

If the file is recognized successfully, the three-dimensional model of the file will be displayed in the right part of the main window.

### **10.** Search tool zero

To begin searching for a tool zero, set the height List of the probe

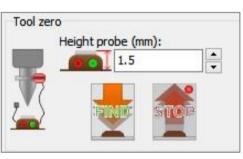

used. Next, click

. Wait until the end of the process.

First you need to configure the input port number for the probe. The Z axis is assigned according to the value found and the height of the probe.

After completing the tool zero search, the tool will return to its original position.

To cancel the tool zero search, click

For the tool zero search to work correctly, you must set the input port number in accordance with the port number on the controller where your probe is connected. Set "Invert" so that the "Value now" in the normal state of the Probe is "Low".

## **11.** Manual control

	Manu	n/min_ 📷	
$\bigotimes$	×	500	< 😢
X1		X10	X100

sets the speed of movement of the

instrument during manual operation.

2	đ	2	2	×	
a	2	7		χ	V
ĸ	2	0	y	G	N
D.	ù	γ	6	1	
-					4

This field

- Speed reduction button.

- Speed increase button.

- **X1** 1% of the set speed or minimum speed.
- X10 10% of the set speed.
- **X100** 100% of the set speed.

The current speed is highlighted in green (100).

For manual control, press the corresponding joystick button

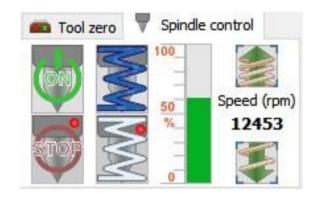

# **12.** Spindle control and cooling

- Spindle power button.
- Spindle off button.

To set the spindle speed, click on the progress bar area.

- Button to increase the rotation of the spindle.
  - Button to reduce the rotation of the spindle.

## **13.** Assignment of coordinates

#### a. Measurement system

The default system of units is millimeters. To set the units in inches, click **INCH MM**. To set the system of units in millimeters, click **INCH MM**. The current coordinate system is highlighted in green.

#### **b. Machine coordinates**

The machine coordinates are the actual coordinates of your axes.

These coordinates are used to define the limits and dimensions of the machine. If machine coordinates are activated for display, they are highlighted in green <u>MACHINE</u>.

### c. Work coordinates

WORK M	ACHINE	INCH MM
X	88.7	783750
0	33.0	080008
Z	12.5	545625 🚽
A	12.8	871875

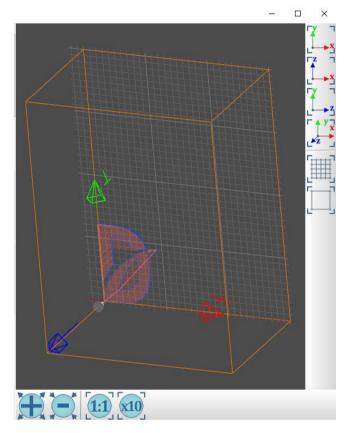

Work coordinates are relative to machine coordinates.

These are the coordinates at which the g-code is executed by default.

If work coordinates are activated for display, they are highlighted in green **WORK**.

# 14. Display 3D model

The code you downloaded is displayed as a 3D model on the right side of the application window.

To rotate the 3D model, move the mouse pointer to the display area of the 3D model. Right-click and hold to move the mouse pointer. You can also use

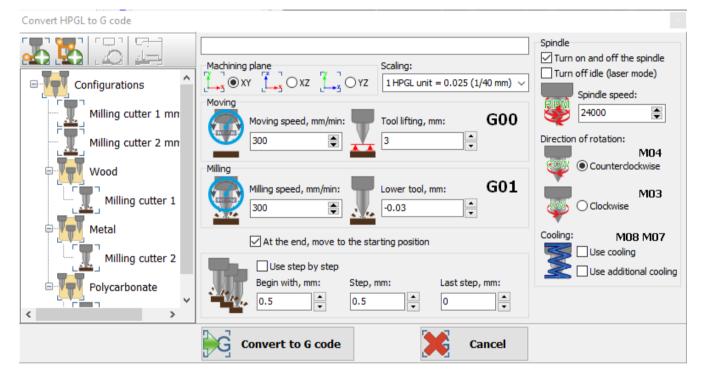

# **15.** Opening HPGL files

To open files in HPGL format, you must click on the button with the image of

the folder, then select the file.

In the window that opens, you must select the parameters for converting HPGL to G-code.

After successful conversion, you will see a three-dimensional model of the file.

# **16. Basic parameters of the HPGL file converter**

Machining plane	The plane in which the HPGL file will be executed.
Scaling: 1 HPGL unit = 0.025 (1/40 mm) ~	The scale corresponds to one HPGL unit per millimeter.
Moving speed, mm/min:	Tool travel speed without milling. Moving between milling areas.
Milling speed, mm/min:	The speed at which the tool moves when milling. Model milling speed.
Tool lifting, mm:	Tool position when moving to the milling area.
Lower tool, mm:	Tool position when milling the model.

#### The spindle will turn on when the HPGL file starts executing, Turn on and off the spindle the spindle turns off when the HPGL file finishes executing. The spindle will only work when milling. This setting is Turn off idle (laser mode) suitable for laser or plasma operation. The spindle speed while executing the HPGL file. When using Spindle speed: \$ 24000 a laser, sets the laser power. The direction of rotation of the spindle is counterclockwise Direction of rotation: M04 when executing the HPGL file. Corresponds to command Counterclockwise M04. The direction of rotation of the spindle is clockwise when M03 O Clockwise executing the HPGL file. Corresponds to command M03. Coolina: M08 M07 Cooling will be turned on before executing the HPGL file. Use cooling Corresponds to commands M08 and M07. Use additional cooling

#### a. Spindle settings of HPGL file converter

# **b. Use step by step**

With the help of "Use step by step" you can set up step-by-step milling (cutting) of models. This will reduce the negative impact on the cutter.

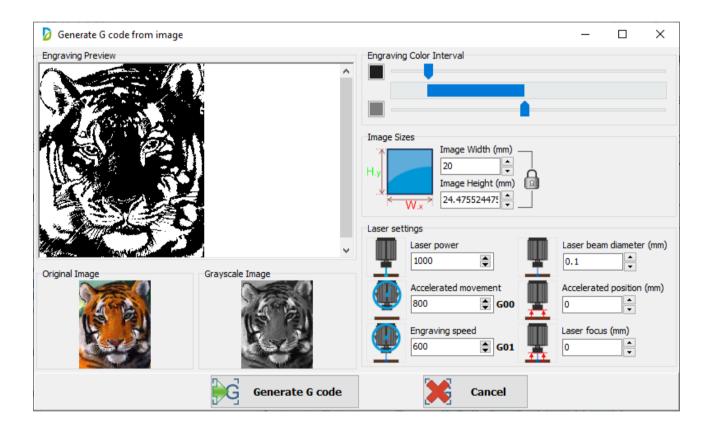

Begin with, mm:	After this axis position, the step milling algorithm will start. For
	example after $Z = 0.5$ mm.
Step, mm:	The cutter will move this distance after each cycle through the entire
	HPGL file. For example, 0.5 mm.
Last step, mm:	If necessary, you can set a fixed distance for the last step.

# **17.** Generating a G-code from an image

To open a file in the format (png, jpeg, gif, bmp), you must click on the button with the image of the folder  $\mathbb{P}$ , or select the necessary file and transfer it to the G-code field.

In the window that opens, you must select the options for converting the image into a G-code.

In the engraving color interval block, you can adjust the color interval.

Engra	aving Color Interval	
	•	

In the Image Sizes block, you can adjust the image size.

Image Sizes	
H.y	Image Width (mm) 20 Image Height (mm) 24.475524475
in Wix re	

a - proportional image resizing.

- not proportional image resizing.

In the Laser Settings block, you can configure the laser settings.

\overline - engraving speed setting

- laser beam diameter adjustment (mm)

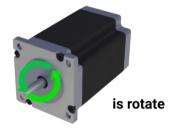

(G00)

#### **18.** Stepper motors

If your stepper motors don't rotate

Turn on Step Invert Step Invert

If you doubt the correct connection of ENA + ENA- then temporarily do not connect it. Make sure your motors spin. The default ENA port is activated on most stepper motor drivers.
